

Inference on a new user's session (test time)

each 4-s window goes left → right; steps ①-④ use statistics computed ONCE from that user's calibration session; ②-④ change no network parameter

Calibration session (same new user, before use)

the ONLY test-side data used: 1 film clip per emotion, first 20 s / 40 s / full; excluded from evaluation

Training (once, on the other subjects — leave-one-subject-out)

nothing here sees the test subject
